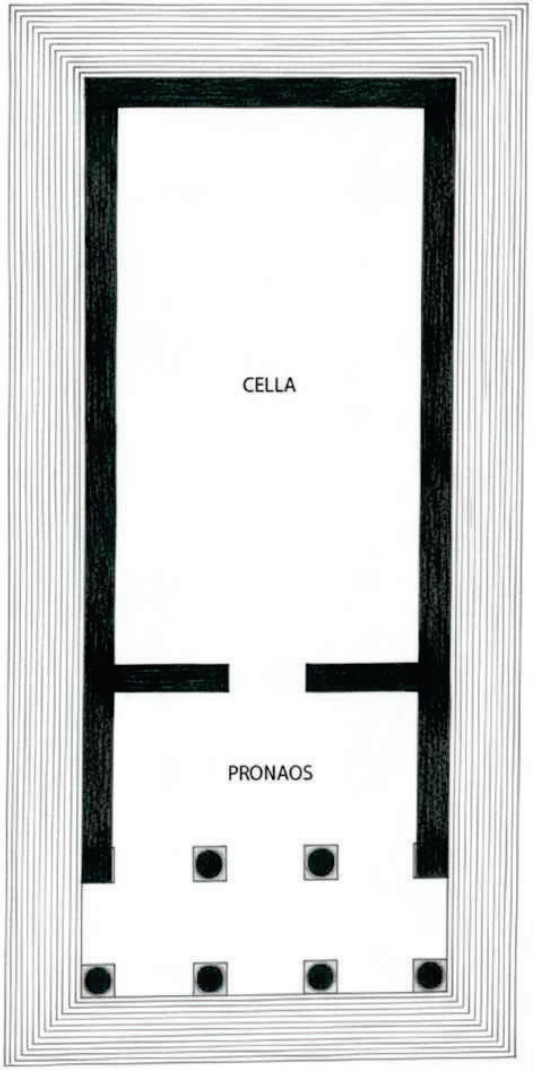
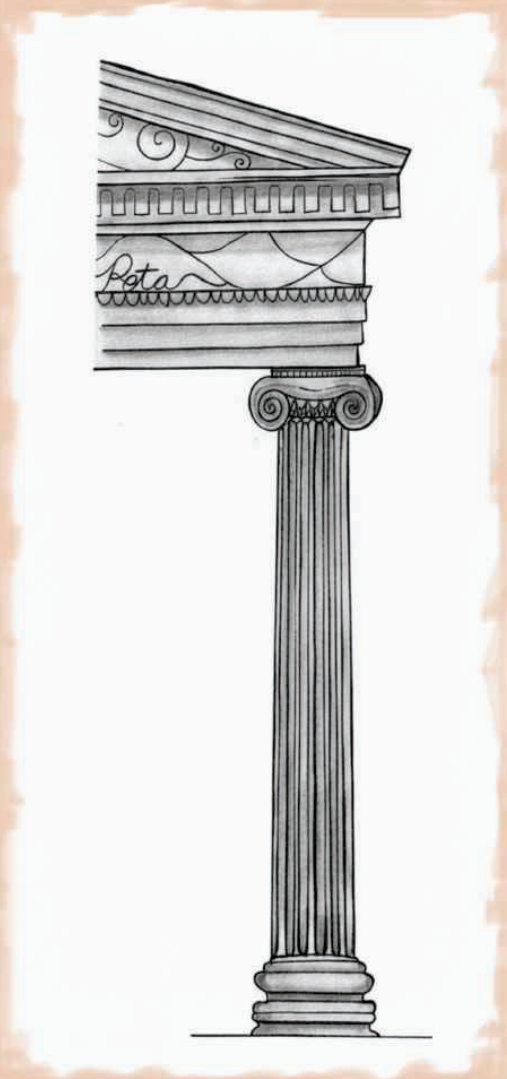
TEMPLE OF VICA POTA

This project is based on designing a Roman temple for the goddess Vica Pota, developed according to Vitruvian principles. The temple is positioned in the Forum, raised on a podium, and framed by porticos and open spaces to highlight its ceremonial and political significance while creating a strong public presence. Its orientation along major thoroughfares ensures visibility and engagement with the civic and religious life of the city. In designing the temple, I followed Vitruvius' guidelines of proportion, order, and composition, using the Ionic order, a tetrastyle entrance, carefully measured column heights, and balanced spacing to create harmony and elegance. Decorative marble revetments, painted stucco, and sculptural reliefs reinforce the temple's dedication to victory while reflecting classical refinement. This project demonstrates a process of applying historical rules to develop a cohesive, functional, and symbolic architectural design.

PLAN + DETAILS



This floor plan documents the spatial organization and architectural language of the temple. The floor plan illustrates the relationship between the pronaos and cella, emphasizing axial alignment, symmetry, and proportional order.


The accompanying detail study analyzes the classical column and establature system, highlighting ornamental articulation, structural rhythm, and hierarchical composition. Together, these drawings demonstrate an understanding of both spatial planning and tectonic refinement.
